Introducing Cauldron

Cauldron is an app that generates recipes based on the user’s available ingredients. A user can not only search for recipes but also contribute.

Log-in grants a user an ability to save any recipes they like. However, a user may choose to log-in as guest if he /she just wants to browse recipes

We grouped the recipes into two categories: Main Dish and Dessert/Beverage.

User will be presented with many ingredients to select. They may select what they have or what they are planning to purchase.

After selecting the ingredients, user will be shown top 3 most relevant recipes that can be cooked from the selected ingredients

When the food picture is clicked, user will be given a choice to save the recipe, open the recipe or go back.

User may click show more button to see other possible recipes that make use of the selected ingredients.

For recipes taken from the web, it will be opened in a browser. For recipes contributed by the other users, it will be opened in the app itself.

Android version of Cauldron is now available at :
